

What is CalPhusion

CalPhusion is the new proprietary technology involving a highly stable Calcium and Phosphorous product and the ability to combine a full micronutrient package.

Benefits

- CalPhusion mimics the natural Calcium Phosphorous uptake in plants resulting in enhanced Calcium availability.
- The benefits of this technology is a highly efficient low input nutrient product that results in higher yields, elimination of Calcium deficiencies, increased plant health, and cost effective applications.
- Utilizing chelation from amino acids, fulvic acids, and other carbon sources CalPhusion remains plant available for an extended period of time resulting in lower usage rates and higher uptake.
